SECOND EDITION

Methods in FOOD ANALYSIS

Physical, Chemical, and Instrumental
Methods of Analysis

Edited by **MAYNARD A. JOSLYN**

*Department of Nutritional Sciences
College Of Agriculture
University of California
Berkeley, California*

Progress in analytical chemistry—methodology, technique, and instrumentation—and the expanded literature in that field have important applications to food analysis. Drawing on these new data the expanded and revised edition of **METHODS IN FOOD ANALYSIS** has been considerably augmented. The book covers the physical and chemical principles involved in the determination of food and food products and the interpretation of the results in terms of their known chemistry. Emphasis has been placed on the scientific basis of particular methods of food analysis, and the procedures discussed have been selected primarily to illustrate the more important methods. The book includes much new material on enzyme and vitamin assay, headspace gas analysis, chemical preservatives, artificial sweeteners, and chemical indices of decomposition and identity.
